Third Party Assurance

Third-Party Assurance: The Key to Ensuring Effective Control

To meet the demands of operational efficiencies, cost-effectiveness and competition, companies oftentimes outsource key business processes. However, managing and assessing the proficiency of these third parties can be difficult, especially with the risks involved in outsourcing data and the global nature of the associated vulnerabilities.

Using third-party assurance reporting can assist in defining and communicating security protocols for each of the outsourced operations, which will ultimately identify the greatest vulnerabilities from a heightened and all-encompassing external perspective.

Third-party assurance also provides businesses with the opportunity to analyze their current level of information security risk, offering insight into the potential impact the risks may have on their operations. Doing so will enable businesses to better monitor and manage their heftiest vulnerabilities in a manner that aligns with their risk tolerance.

To combat the inherent risks of relying on a globalized supply chain, businesses must tighten regulations among third parties to ensure effective control. By employing third-party assurance reporting, businesses can:

- Benchmark, profile and hold accountable all third-party suppliers for their cybersecurity procedures and policies
- Negotiate with third-party suppliers and acquisitions based on information security risk
- Enhance their own security posture by aligning with and choosing third parties that meet their security mission

SubRosa Cyber Solutions' Third-Party Assurance program is a proven framework for quickly and expertly analyzing the risks currently posed by third parties and supply chain operations to your business. SubRosa can work closely with you to implement vendor risk management tools that allow your business to better manage vulnerabilities related to security controls and actions of third parties.
